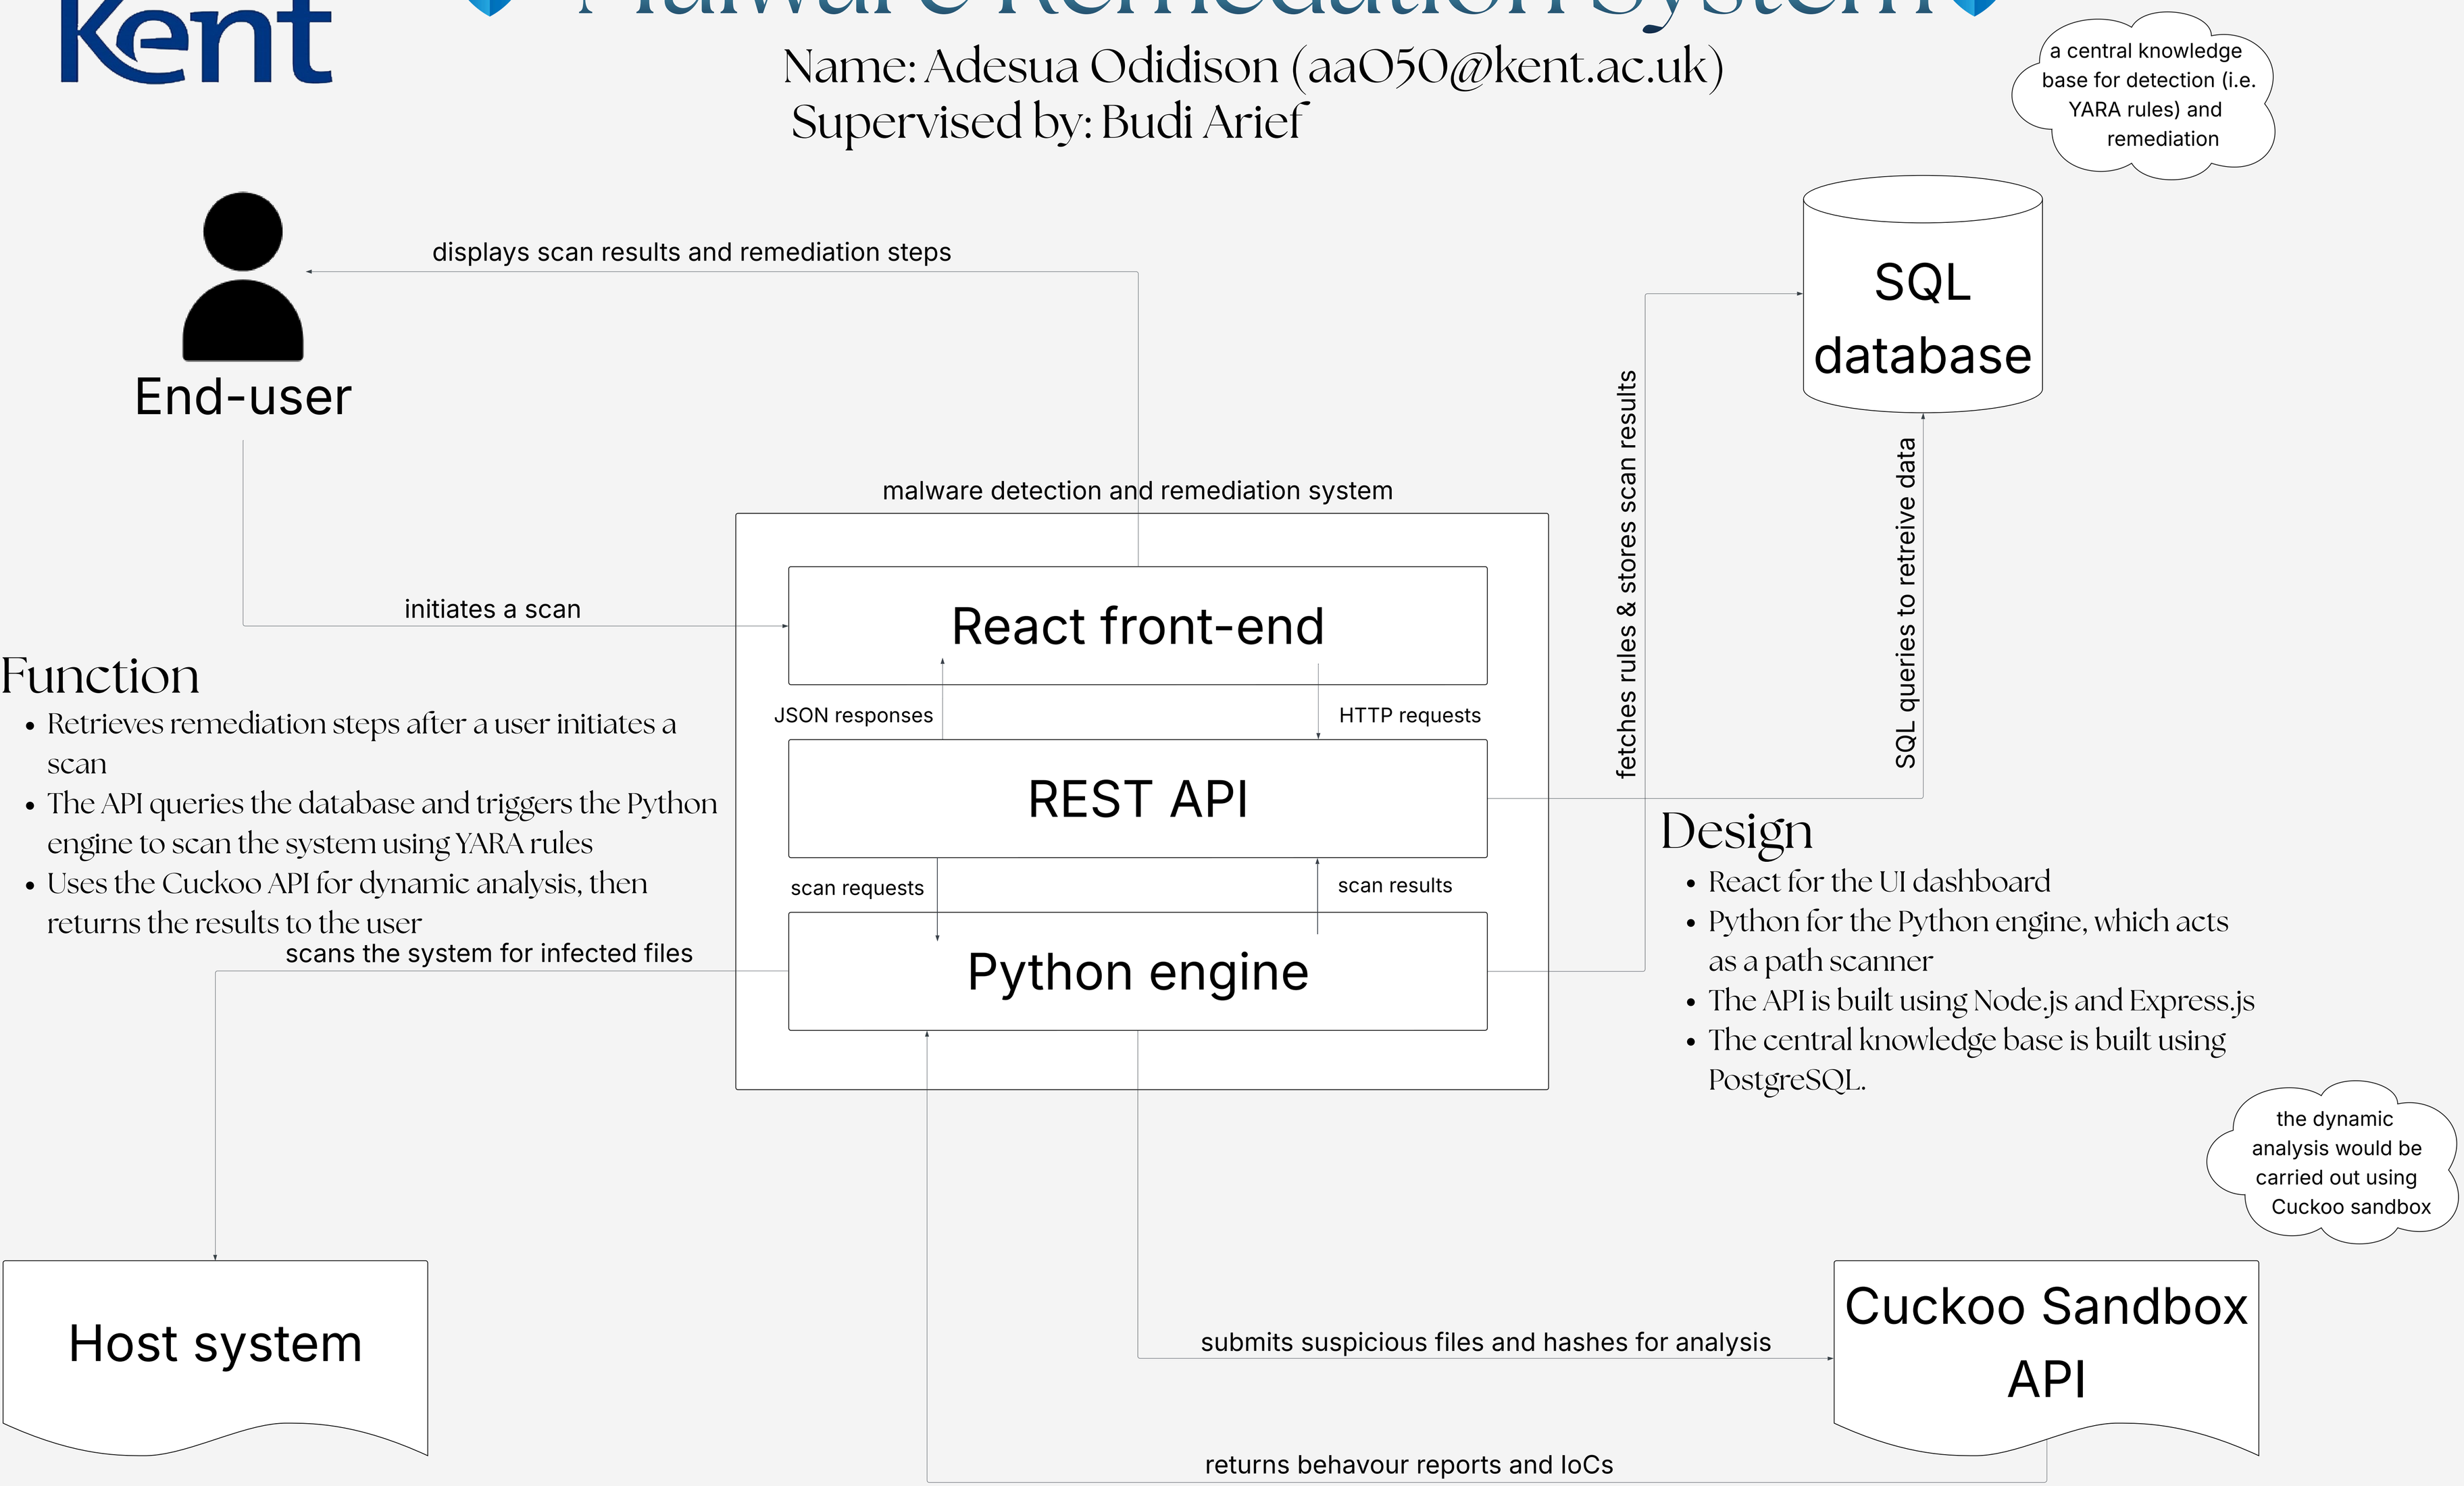
Malware Remediation System

Name: Adesua Odidison (aa050@kent.ac.uk)
Supervised by: Budi Arief



Function

- Retrieves remediation steps after a user initiates a scan
- The API queries the database and triggers the Python engine to scan the system using YARA rules
- Uses the Cuckoo API for dynamic analysis, then returns the results to the user

Design

- React for the UI dashboard
- Python for the Python engine, which acts as a path scanner
- The API is built using Node.js and Express.js
- The central knowledge base is built using PostgreSQL.

Tech Stack:

Express JS
